## Description

[0001] The present invention relates to novel [1,2,4]triazolo[1,5-c]pyrimidine derivatives and pharmaceutically acceptable salts thereof which show adenosine A<sub>2A</sub> receptor antagonism and are useful for treating or preventing various diseases induced by hyperactivity of adenosine A<sub>2A</sub> receptors (for example, Parkinson's disease, senile dementia, or depression).

[0002] It is known that adenosine shows attenuation of the activity of neurotransmitters via an A<sub>2A</sub> receptor [*European Journal of Pharmacology*, 168: 285 (1989)]. Consequently, adenosine A<sub>2A</sub> receptor antagonists are expected as remedies or preventives for various diseases induced by hyperactivity of adenosine A<sub>2A</sub> receptors, such as a remedy for Parkinson's disease, an anti-dementia drug, a remedy for depression, and the like. Furthermore, the above antagonists are expected to show therapeutic and symptom-improving effects upon Alzheimer's disease, progressive supranuclear palsy, AIDS encephalopathy, propagative cavernous encephalopathy, multiple sclerosis, amyotrophic lateral sclerosis, Huntington's disease, multiple system atrophy, cerebral ischemia, somnopathy, ischemic heart disease, intermittent claudication, or the like.

[0003] On the other hand, [1,2,4]triazolo[1,5-c]pyrimidine derivatives are disclosed as compounds having diuresis activity in Japanese Published Unexamined Patent Application No. 13792/85, as compounds having antiasthma activity in Japanese Published Unexamined Patent Application No. 56983/85, and as compounds having bronchodilation activity in Japanese Published Unexamined Patent Application No. 167592/84.

[0004] EP-A-0 666 079 discloses a remedy for Parkinson's disease, which contains a polycyclic compound. This polycyclic compound exhibits a heterocyclic skeleton selected from the group consisting of triazolotriazine, pyrazolotriazine, triazoloquinazoline and pyrazolo[4,3-e]triazolopyrimidine. EP-A-0 263 071 discloses 2-substituted-e-fused-[1,2,4]triazolo[1,5-c]pyrimidines, pharmaceutical compositions, and uses thereof as benzodiazepine agonists and/or antagonists and adenosine antagonists. Furthermore, EP-A-0 459 702 discloses polycyclic compounds, which exhibit the heterocyclic skeletons of triazolotriazine and pyrazolotriazine, processes for the manufacture of these compounds and pharmaceutical compositions containing them. These compounds are useful as adenosine antagonists. J. Med. Chem., 31, 1988, 1014-1020 discloses the synthesis and the structure-activity profile of triazoloquinazolines, which exhibit adenosine A<sub>2</sub> receptor antagonism, whereas the structure-activity relationships for derivatives of adenosine, xanthines and various heterocyclic compounds as adenosine receptor agonists and antagonists are described in J. Med. Chem., 35, 1992, 407-422.

[0005] However, adenosine receptor antagonism of [1,2,4]triazolo[1,5-c]pyrimidine derivatives and their activity on the central nervous system are not known.

[0075] Next, pharmacological activities of Compound (I) are described with test examples.

#### Test Example 1

Adenosine receptor binding activity (adenosine A<sub>2A</sub> receptor binding test)

[0076] This test was carried out by slightly modifying the method of *Bruns et al.* [*Molecular Pharmacology*, 29: 331 (1986)].

[0077] Corpus striatum of a rat was suspended in an ice-cooled 50 mM tris(hydroxymethyl)aminomethane hydrochloride (hereinafter referred to as "Tris-HCL") buffer (pH 7.7) using Polytron Homogenizer (manufactured by Kintematica Co.). The suspension was centrifuged (50,000 x g, 10 minutes), and the obtained precipitate was re-suspended in the same amount of 50 mM Tris-HCl buffer. The suspension was centrifuged under the same conditions, and the final precipitate was suspended in 50 mM Tris-HCl [containing 10 mM magnesium chloride and 0.02 unit/mg tissue of adenosine deaminase (manufactured by Sigma Co.)] to give a tissue concentration of 5 mg (wet weight)/ml.

[0078] To 1 ml of the tissue suspension thus prepared were added 50  $\mu$ l of tritium-labeled CGS 21680 [<sup>3</sup>H-2-[p-(2-carboxyethyl)phenethylamino]-5'-N ethylcarboxamido]adenosine: 40 Ci/mmol; manufactured by New England Nuclear Co. [*The Journal of Pharmacology and Experimental Therapeutics*, 251: 888 (1989)]] (final concentration: 4.0 nM) and 50  $\mu$ l of a test compound. The resulting mixture was allowed to stand for 120 minutes at 25°C, and then rapidly filtered by suction through a glass fiber filter (GF/C, manufactured by Whatman Co.) The filter was immediately washed three

# EP 0 976 753 B1

times with 5  $\mu$ l of an ice-cooled 50 mM Tris-HCl buffer, and transferred to a vial, a scintillator (EX-H, manufactured by Wako Pure Chemical Industries, Ltd.) was added thereto, and the radioactivity on the filter was determined with a liquid scintillation counter (manufactured by Packard Instrument Co.)

[0079] The inhibition ratio of the test compound against the  $A_{2A}$  receptor binding ( $^3H$ -CGS 21680 binding) was calculated by the following equation:

$$\begin{aligned} & \text{Inhibition ratio (\%)} \\ &= \{1 - (\text{Amount of the binding in the} \\ & \text{presence of the test compound} - \text{Amount of} \\ & \text{the nonspecific binding}) \\ & / (\text{Amount of the total binding} - \text{Amount of} \\ & \text{the nonspecific binding})\} \times 100 \end{aligned}$$

(Note) Amount of the total binding means the amount of radioactivity of  $^3H$ -CGS 21680 bound in the absence of the test compound. Amount of the nonspecific binding means the amount of radioactivity of  $^3H$ -CGS 21680 bound in the presence of 100 mM cyclopentyladenosine (CPA, manufactured by Sigma Co.). Amount of the binding in the presence of the test compound means the amount of radioactivity of  $^3H$ -CGS 21680 bound in the presence of the test compound at various levels of concentrations.

[0080] The results are shown in Table 2.

[0081] Compounds (I) and pharmaceutically acceptable salts thereof show strong adenosine A<sub>2A</sub> receptor antagonism. Consequently, it was suggested that a drug which contains Compound (I) as the active ingredient would be useful for various diseases induced by hyperactivity of adenosine A<sub>2A</sub> receptors (for example, Parkinson's disease, senile dementia or depression).

#### Test Example 2

#### Activity on CGS 21680-induced catalepsy

[0082] Parkinson's disease is motor deficit based on the degeneration and cell death of the nigrostriatal dopaminergic neuron. When CGS 21680 (adenosine A<sub>2A</sub> receptor agonist) is administered into the intracerebro-ventricle, it directly inhibits inhibitory synaptic transmission of GABA in medium sized spiny neuron in the striatum via the adenosine A<sub>2A</sub> receptor. [Journal of Neuroscience, 16: 605 (1996)]. Accordingly, it is considered that adenosine A<sub>2A</sub> receptor agonists positively regulate the output of the striopallidal GABAergic neurons and, as a result, catalepsy is induced by the administration of CGS 21680.

[0083] This test was carried out using 10 animals per group of male ddY mice of 5 week age (22 to 25 g in body weight, Japan SLC). CGS 21680 (manufactured by RBI) was dissolved in a physiological saline (manufactured by Otsuka Pharmaceutical), and 10 µg/20 µl of the solution was injected into mouse intracerebro-ventricle. Test compounds were used by suspending them in distilled water containing 0.3% of polyoxyethylene(20)sorbitan monooleate (hereinafter referred to as "Tween 80") (manufactured by Otsuka Pharmaceutical). The suspension containing each of the test compounds or a solution which does not contain the test compound (distilled water containing 0.3% Tween 80; control) was orally administered (0.1 ml per 10 g mouse body weight) 30 minutes before the injection of CGS 21680 into the intracerebro-ventricle. One hour after the administration of the test compound, only forelimbs or only hindlimbs of each animal were laid on a vertically arranged stand made of acrylic, having a size of 4.5 cm in height and 1.0 cm in width, to measure catalepsy symptoms. All of the test compounds were administered orally in a dose of 10 mg/kg.

[0084] The following shows judging criteria of catalepsy score.

5	The cataleptic posture of both forelimbs and hindlimbs lasted not less than 10 seconds.

[0085] The effect was judged by total catalepsy scores of 10 animals in one group (the maximum is 50 points). When the total score was 40 points or less, the activity of drugs was judged positive. The number of animals showing remission of catalepsy was expressed by the number of cases in which the catalepsy score was 4 points or less in 10 cases. The catalepsy remission ratio was expressed as the percentage of the total score in the test compound-administered group to the total score in the control group.

## Test Example 3

## Activity on haloperidol-induced catalepsy

**[0087]** Parkinson's disease is a disease based on the degeneration and cell death of the nigrostriatal dopaminergic neuron. When haloperidol (dopamine D1/D2 antagonist) is administered, catalepsy is induced by the block of postsynaptic D2 receptor. This haloperidol-induced catalepsy is known as a classic model in which symptoms of Parkinson's disease are produced by drug administration [*European Journal of Pharmacology*, 182: 327 (1990) and U.S. Patent 3,991,207].

**[0088]** This test was carried out using 10 animals per group of male ddY mice of 5 week age (22 to 24 g in body weight, Japan SLC). Haloperidol (manufactured by Janssen) was suspended in 0.3% CMC and administered intraperitoneally into mice at a dose of 1.0 mg/kg. Each test compound was used by mixing it with Tween 80 and then suspending it in distilled water for injection (manufactured by Otsuka Pharmaceutical). Also, L-DOPA (manufactured by Kyowa Hakko Kogyo Co., Ltd.) and benserazide HCl (manufactured by Kyowa Hakko Kogyo Co., Ltd.) were used by suspending them in 0.3% CMC. One hour after the intraperitoneal injection of haloperidol, the suspension containing each of the test compounds or a suspension which does not contain the test compound [distilled water for injection (manufactured by Otsuka Pharmaceutical) containing Tween 80; control] was orally administered (0.1 ml per 10 g mouse body weight) and, one hour after the administration of test compound, only forelimbs or only hindlimbs of each animal were laid on a stand having a size of 4.5 cm in height and 1.0 cm in width, to measure catalepsy symptoms. All of the test compounds were administered orally in a dose of 10 mg/kg, and 100 mg/kg of L-DOPA and 25 mg/kg of benserazide were used in combination as a control drug and administered by intraperitoneal injection. The catalepsy score was evaluated by the judging criteria shown in the above-described Table 3.

**[0089]** The effect was judged by total catalepsy scores of 10 animals in one group (the maximum is 50 points). When the total score was 40 points or less, the activity of drugs was judged positive. The number of animals showing remission of catalepsy was expressed by the number of cases in which the catalepsy score was 4 points or less in 10 cases. The catalepsy remission ratio was expressed as the percentage of the total score in the test compound-administered group to the total score in the control group.

**[0090]** The results are shown in Table 5.

## Test Example 4

## Activity on clonidine-induced aggressive behavior

[0091] Effect of test compounds to increase aggressive behavior induced by the intraperitoneal injection of clonidine [*European Journal of Pharmacology*, 29: 374 (1968)] was examined.

[0092] This test was carried out using 2 animals per group of male ddY mice of 20 to 25 g in body weight (Japan SLC). Each test compound was used by mixing it with Tween 80 and then suspending it in distilled water for injection (manufactured by Otsuka Pharmaceutical), and clonidine hydrochloride (manufactured by Sigma Co.) was used by dissolving it in physiological saline (manufactured by Otsuka Pharmaceutical). The suspension containing each of the test compounds or a suspension which does not contain the test compound (control) was orally administered (0.1 ml per 10 g mouse body weight) and, 60 minutes after the administration of the test compound, clonidine was administered by intraperitoneal injection in a dose of 20 mg/kg. The number of aggressive behavior of each mouse was measured for 30 minutes immediately after the administration of clonidine. The effect was judged by comparing values of the number of aggressive behavior in the control and those in test compound-administered groups (significance test: Student t-test).

[0093] The results are shown in Table 6.

[0094] It was confirmed by Test Examples 2 to 4 that Test Compounds (I) have anti-Parkinson's disease activity and anti-depressant activity.

## Test Example 5

Activity in a Parkinson's disease model [common marmoset treated with 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP)]

[0095] Parkinson's disease is a disease based on the degeneration and cell death of the nigrostriatal dopaminergic neuron. In the primates, treatment with a dopamine neurotoxin 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (herein after referred to as "MPTP") causes selective degeneration and dropout of the nigrostriatal dopaminergic neuron and

shows akinesia, rigidity of muscle or the like. These MPTP-treated primates are known as a model of Parkinson's disease [*Proceedings of the National Academy of Science USA*, 80: 4546 (1983)]. Common marmoset belongs to *Anthropoidae*, and it is known that it shows symptoms of Parkinson's disease caused by MPTP as in the case of other animals of *Anthropoidae* [*Neuroscience Letter*, 57: 37. (1985)].

[0096] This test was carried out using 4 animals per group of female and male common marmosets of 2 to 3 year age (300 to 375 g in body weight, CLEA Japan). MPTP (manufactured by RBI) was dissolved in a physiological saline for injection (manufactured by Otsuka Pharmaceutical) and administered to common marmoset once a day for 5 days by subcutaneous injection in a dose of 2.0 mg/kg. Six weeks or more after the administration, animals showing chronic symptoms of Parkinson's disease were used in the test of test compounds. Each test compound was used by suspending it in 0.3% Tween 80 and 10% sucrose solution. The same solution containing no test compound was used as a control. One hour before the administration of the test compound, the animals to be tested were put into an observation cage (equipped with a spontaneous locomotor count measuring apparatus) to adapt them to the environment. Symptoms of Parkinson's disease were observed from a one way see-through window at 30 minutes' interval for 8 hours to score their motor disability. The spontaneous locomotor count was measured at 30 minutes' interval for 12 hours by a computer-controlled automatic measuring apparatus. Symptoms of Parkinson's disease were judged based on the judging criteria of each item shown in the following, and the total of the points was used as the score of each animal.

[0097] Relationship between observation items and scores is shown in Table 7 below.

Table 7

Judging criteria of the symptoms of Parkinson's disease						
Items observed	Score	0	1	2	3	4
Attention		normal	decrease	sleeping tendency		
Observation			yes	decrease	no	
Blinking			normal	abnormal		
Posture		normal	abnormality in trunk, tail or limbs (1 point for each)			all abnormal
Balance		normal	asymmetry	cannot stand	drop out	
Reaction		normal	decrease	slow	no	
Utterance		normal	decrease	no		
Total	0-17 points					

[0098] The effect was judged by comparing average scores of the symptoms of Parkinson's disease in 4 animals per group in the test compound-administered and solvent-administered groups (significance test: Sign-Wilcoxon test). Also with respect to the spontaneous locomotor count, the effect was judged by comparing the test compound-administered and solvent-administered groups.

[0099] The results are shown in Figs. 1 and 2 (the score of symptoms of Parkinson's disease was expressed as the total score of respective observation items, and the spontaneous locomotor count was expressed as the total locomotor count due to its continuous measurement).

[0100] It was confirmed that Compound 63 is effective in the common marmoset MPTP-treated Parkinson's disease model.

#### Test Example 6

Forced swimming method (measurement of immobility time)

[0101] Ten animals per group of ddY male mice (21 to 26 g in body weight, Japan SLC) were used as the experimental animal. During the preliminary feeding period, they were allowed to have feed and water freely in an animal room of a room temperature of  $23 \pm 1^\circ\text{C}$  and a humidity of  $55 \pm 5\%$ . Animals which showed abnormal reactions in terms of spontaneous activity, myotonia, eyesight or the like were excluded. The drugs to be tested were suspended in a 0.3% Tween 80 solution and orally administered one hour before the test. In the negative control group, 10 ml/kg of the 0.3% Tween 80 solution alone was orally administered. Measurement of immobility time was carried out in accordance with the method of Porsolt [*Arch. int Pharmacodyn.*, 229: 327-336 (1977)]. That is, a cylindrical transparent acrylic water tank (10 cm in diameter and 25 cm in height) was filled with 9 cm in depth of water having a temperature of  $23 \pm 1^\circ\text{C}$ , and mice were forced to swim for 6 minutes. When mice are put into water, they immediately start to swim trying to

escape from the tank, but the motion gradually decreases 1 to 2 minutes thereafter. Measurement of immobility time was carried out by leaving them for 2 minutes as such and thereafter measuring the period of time during which they did not show the escaping action (immobility time: behavioral despair) for 4 minutes (240 seconds) at one second's interval. In order to reduce effects of daily rhythm, the test was carried out by using 5 of the 10 animals per group in the morning, and the remaining 5 animals in the afternoon. Further, measurement of immobility time was carried out by observing 2 animals at the same time and by not telling the observers distinctions about the solvent-administered group and doses of administered test drugs. Statistical analysis of the results was carried out by a multiple comparison test of the solvent-administered control group and each of the test drug-administered groups by Steel-test.

[0102] Significant immobility time-shortening activity was observed by 10 mg/kg oral administration of Compounds 45, 62, 66, 67, 69, 70, 71, 72, 74, 78, 80, 84, 88, 89, 90, 96, 99, 100, 103, 104, 115, 126, 127, 165 and 167. Since each of these compounds having such activity showed strong antagonism for the A<sub>2A</sub> receptor (inhibition ratio of 50% or more at 10<sup>-7</sup> M), a general correlation was found between A<sub>2A</sub> antagonism and anti-depression activity.

Test Example 7 ,

Activity in learned helplessness (LH) model

1) Animals used

[0103] As experimental animals, 10 to 15 animals per group of SD male rats (220 to 320 g in body weight, 7 week age, Charles River Japan, Atsugi) were used. During the preliminary feeding period, they were allowed to have feed (CRF-1, Oriental Yeast, Tokyo) and water (tap water) freely in an animal room at a room temperature of 22 to 24°C and a humidity of 50 to 60%. The test compound was orally administered in a dose of 2 ml/kg and 1 hour before FR 1 (fixed ratio schedule 1: repetition of fixed trial conditions) on the second day of the test.

2) Preparation of learned helplessness model

[0104] A shuttle box apparatus (TK-401S; manufactured by UNICOM, Chiba) was used as the learning test apparatus. On the first day, a partition wall was set at the center of the shuttle box to arrange two rooms, and one rat was put into each of the rooms. Each of the two rooms (22 × 20 × 26 cm) has a stainless steel floor grid to which an electric shock (1.3 mA, scramble stimulus) can be applied. Each animal was put into the shuttle box for 50 minutes of which 25 minutes were used as a period for charging inescapable electric shock (IES) by random continued times (10 to 90 seconds) and random on-off, off-on (10 to 90 seconds) effected by computer control.

[0105] On the second day, a shuttle box test was carried out by slightly modifying the method of Maier *et al.* [*J. Comp. Physiol. Psychol.*, 85: 581-592 (1973)] and the method of Geoffroy & Christensen [*Drug Dev. Res.*, 29: 48-55 (1993)]. The partition wall in the center was removed and replaced by a hurdle of 2 cm in height to arrange two rooms. In the shuttle box test, FR 1 (buzzer 10 sec, 0.6 mA foot shock; 5 sec, interval time; 10 sec/trial, 15 escape trials) was carried, followed continuously by FR 2 (0.6 mA foot shock; 10 sec, interval time; 0.5 sec, 0.6 mA foot shock; 10 sec, interval time; 15 sec/trial, 15 trials). The escape reaction was judged success when both of the two escape times in FR 2 were less than 10 seconds, and the escape response was calculated by the following formula: "the number of trials of successful escape / 15 × 100 = escape response (%)" Further, migration in the box other than the escape reaction observed during a period between trials (resting time) was used as an index of psychomotor stimulant action by calculating "total number of migration in the box / 15 × 100 = intertrial response (%)" 3) Statistical treatment

[0106] The results were statistically analyzed by treating the difference between normal control and IES-loaded control with Student-t and carrying out a multiple comparison test for the escape responses and intertrial responses between the IES-loaded control group and the test drug-administered group by the Steel method, and the results were treated as significant when the level of significance was less than 5%. In this case, an SAS statistical analysis software was used in the statistical analysis.

(Average % ± SE)				
Test compound	Electric shock (IES)	Dose (mg/kg, po)	Escape response	Intertrial response
Normal control	-		76.7 ± 9.1	7.3 ± 4.8
Loaded control	+		9.3 ± 9.3###	0.7 ± 0.7
Compound 45	+	5.0	64 ± 9.8**	6.7 ± 3.8

###: p<0.001 comparison with normal control group;

\*\*: p<0.01 comparison with loaded control group

[0107] According to the test results, it was shown that Compound 45 can significantly reverse a reduced escape response induced by the IES loading and therefore has an anti-depressant activity, and that its psychomotor stimulant activity is weak because of no difference in the intertrial responses between the test compound-administered group and electric shock loaded control group.

[0108] The anti-depressant activity (activity to inhibit reduction of escape response) was markedly attenuated when a small amount of an adenosine A<sub>2A</sub> agonist CGS 21680 (20 µg/2 µl) was injected into the nucleus accumbens 30 minutes before FR 1 on the second day. Consequently, it was suggested that the pharmacological activity of this compound is mediated by the A<sub>2A</sub> receptor.

[0109] Compound (I) or a pharmaceutically acceptable salt thereof can be administered as it is, but it is generally preferred to provide it as various pharmaceutical preparations. Further, such pharmaceutical preparations are used in animals and human.

[0110] The pharmaceutical preparations of the present invention can contain Compound (I) or a pharmaceutically acceptable salt thereof as the active ingredient alone or together with other optional active ingredients for the treatment of different diseases. Further, these pharmaceutical preparations are produced by optional methods well known in the technical field of pharmaceutics, by mixing the active ingredient with one or more pharmaceutically acceptable carriers.

[0111] It is preferred to select the route of administration which is most effective in the treatment. Examples include oral administration and parenteral administrations, such as intraoral, intratracheal, rectal, subcutaneous, intramuscular, intravenous and the like.

[0112] Examples of the dosage form include sprays, capsules, tablets, granules, syrups, emulsions, suppositories, injections, ointments, tapes and the like.

[0113] Liquid preparations, such as emulsions, syrups and the like, suitable for oral administration can be produced using, for example, water, sugars, such as fructose, sucrose, sorbitol and the like, glycols, such as polyethylene glycol, propylene glycol and the like, oils, such as sesame oil, olive oil, soybean oil and the like, antiseptics, such as p-hydroxybenzoic acid esters and the like, and flavors, such as strawberry flavor, peppermint and the like. Further, capsules, tablets, powders, granules and the like can be produced using, for example, excipients, such as lactose, glucose, sucrose, mannitol and the like, disintegrators, such as starch, sodium alginate and the like, lubricants, such as magnesium stearate, talc and the like, binders, such as polyvinyl alcohol, hydroxypropylcellulose, gelatin and the like, surfactants, such as fatty acid esters and the like, and plasticizers, such as glycerol and the like.

[0114] Preparations suitable for parenteral administration are preferably sterile aqueous preparations which contain an active compound that becomes isotonic in the blood of acceptors. For example, in the case of injections, a solution for injection is prepared using a carrier comprising a salt solution, a glucose solution or a mixture of salt water with a glucose solution. In that case, the injections are prepared in the form of a solution, suspension or dispersion in the usual way using an appropriate auxiliary agent. Preparations for rectal administration are prepared using a carrier, such as cacao butter, hydrogenated fat, hydrogenated carboxylic acid or the like, and provided as suppositories. Further, sprays are prepared using an active compound and a carrier which does not stimulate the oral cavity and airway mucous membrane of the acceptors and can facilitate absorption of the active compound by dispersing it in fine particles. Specific examples include lactose, glycerol and the like. Preparations, such as aerosols, dry powders and the like, can be produced depending on the properties of the active compound and the carriers to be used.

[0115] Additionally, these parenteral preparations can also be mixed with one or more auxiliary agents selected from the diluents, flavors, antiseptics, excipients, disintegrators, lubricants, binders, surfactants, plasticizers and the like exemplified in relation to the oral preparations.

[0116] The effective amount of Compound (I) or a pharmaceutically acceptable salt thereof and the frequency of its administration vary depending on the administration mode, the age and body weight of each patient and properties and seriousness of the symptoms to be treated, but it is generally preferred to administer it in a dose of from 1 to 50 mg/kg per day, by dividing the daily dose into 3 or 4 doses per day. However, these doses may vary depending on the above-described various conditions.

[0155] In 80 ml of xylene, 4.80 g (16.9 mmol) of diphosphorus pentaoxide was suspended, and 7.18 ml (33.8 mmol) of hexamethyldisiloxane was added thereto, followed by stirring at 90°C for 2 hours. Next, 3.85 g (11.2 mmol) of Compound j obtained in Reference Example 10 was added thereto, followed by refluxing for 5 hours. The reaction mixture was cooled to room temperature and extracted by adding ethyl acetate and water. The organic phase was washed with a saturated brine and dried over anhydrous magnesium sulfate. The solvent was evaporated under reduced pressure, and the residue was purified by silica gel column chromatography [chloroform-hexane (9:1)] to give 2.83 g of a main product.

[0156] In 25 ml of DMSO, 2.8 g of the obtained main product was dissolved, and 6.98 ml (46.3 mmol) of veratrylamine was added thereto, followed by stirring at 140°C for 2 hours.
